# Waukesha Pump

FLEXIBLE IMPELLER	CENTRIFUGAL	VANE
<p><b>HOW IT WORKS:</b></p> <p>a. Flexible impeller blades, upon leaving offset cam, create a nearly perfect vacuum for liquid self-priming.</p> <p>b. As impeller rotates, each successive blade draws in liquid and carries it from intake to outlet port.</p> <p>c. As flexible impeller blades contact the offset cam they bend with a squeezing action that provides continuous, uniform flow.</p>	<p><b>HOW IT WORKS:</b></p> <p>a. Liquid enters inlet port of pump. Level of liquid must be high enough above pump for gravity to push it into pump or pump must be initially primed.</p> <p>b. Rotating impeller gives velocity energy to the liquid moving it to the periphery of the volute casing and towards the discharge port.</p> <p>c. Volute casing discharge arrangement converts velocity energy into static pressure or available pump head. Flow rate is dependent upon restrictions in the inlet and outlet piping and the head change that the liquid needs to be moved.</p>	<p><b>HOW IT WORKS:</b></p> <p>a. Vanes, upon leaving eccentric portion of liner, create a partial vacuum for priming.</p> <p>b. As rotor rotates, each successive vane draws and carries liquid from intake to discharge port.</p> <p>c. When the vanes again contact the eccentric portion of the liner, they force liquid out the discharge port.</p>
<p><b>FEATURES</b></p> <p>Versatile. The flexible impeller pump combines the priming feature of positive displacement type pumps with the general transfer ability of centrifugals. It will pump either thin or viscous liquids - can handle more solids in suspension than other types of rotary pumps. It operates at low or high speeds - can be mounted at any angle and pumps in either direction with equal efficiency.</p> <p>Self-priming. Pumps instantly with dry suction lifts up to 10 feet up to 25 feet when wetted. Permits cleaner, safer installations. No foot valve required.</p> <p>Simplicity. One moving part - a tough, long-lived, wear-resistant flexible impeller lubricated by the liquid being pumped. No metal-to-metal pumping action - no gears to jam, slip or become noisy.</p> <p>More Capacity. Flexible impeller pumps, in general, require less space because they deliver greater flow for weight, size and price than other types of pumps.</p>	<p><b>FEATURES</b></p> <p>High Volume Flow. Centrifugal pumps handle high volumes with a smooth, non-pulsating flow. The flow rate can be regulated from maximum output to no flow with no damage to the pump. An excellent pump for general transfer applications.</p> <p>Low Maintenance. Wear due to operation is minimal. Easy disassembly for quick service. Few moving parts.</p> <p>Easy Installation. Compact size. Discharge port can be rotated to various positions for ease of piping.</p>	<p><b>FEATURES</b></p> <p>Durable. Heavy duty construction in quality materials gives long life. Body is designed to resist environmental damage. The vanes and rotor are constructed of a wear resistant long life material.</p> <p>Self-priming. Lifts liquids up to 3 feet for self-priming. Permits less complicated and more economical installations.</p> <p>Simplicity. Few moving parts to replace. Maintenance is as simple as loosening three screws. Rotor, vanes and seal are lubricated by the liquid being pumped.</p> <p>Versatile. Excellent compact unit for general utility or transfer applications. Will pump thin or somewhat viscous products. Can be mounted at any angle and run in either direction.</p>

	<p><b>Leak free mating surfaces</b> All Waukesha pumps incorporate sealed construction, which eliminates leaks and simplifies assembly after maintenance. Many competitors utilize leak prone clamp bands.</p> <p><b>One air valve fits all</b> - The NCF-40, 50 &amp; 60 Series pumps utilize one common air valve assembly, reducing parts inventory and assembly confusion. The NCF-50 &amp; 60 have a common air valve as well. One air valve concept is used in all Waukesha NCF Series pumps!</p> <p><b>Outside accessibility</b> - Inspection or maintenance of every Waukesha air valve can be performed without removing the pump from service.</p> <p><b>Plant Valve</b> - Unique to the Waukesha design is an individual modular plant valve that actuates the air valve. It is depressed slightly by the inner center disc, opening a pressure line at one shifting to "close" it is maintained free with no combustible vapor rings or lubricated dynamic seals to replace or repair.</p>
